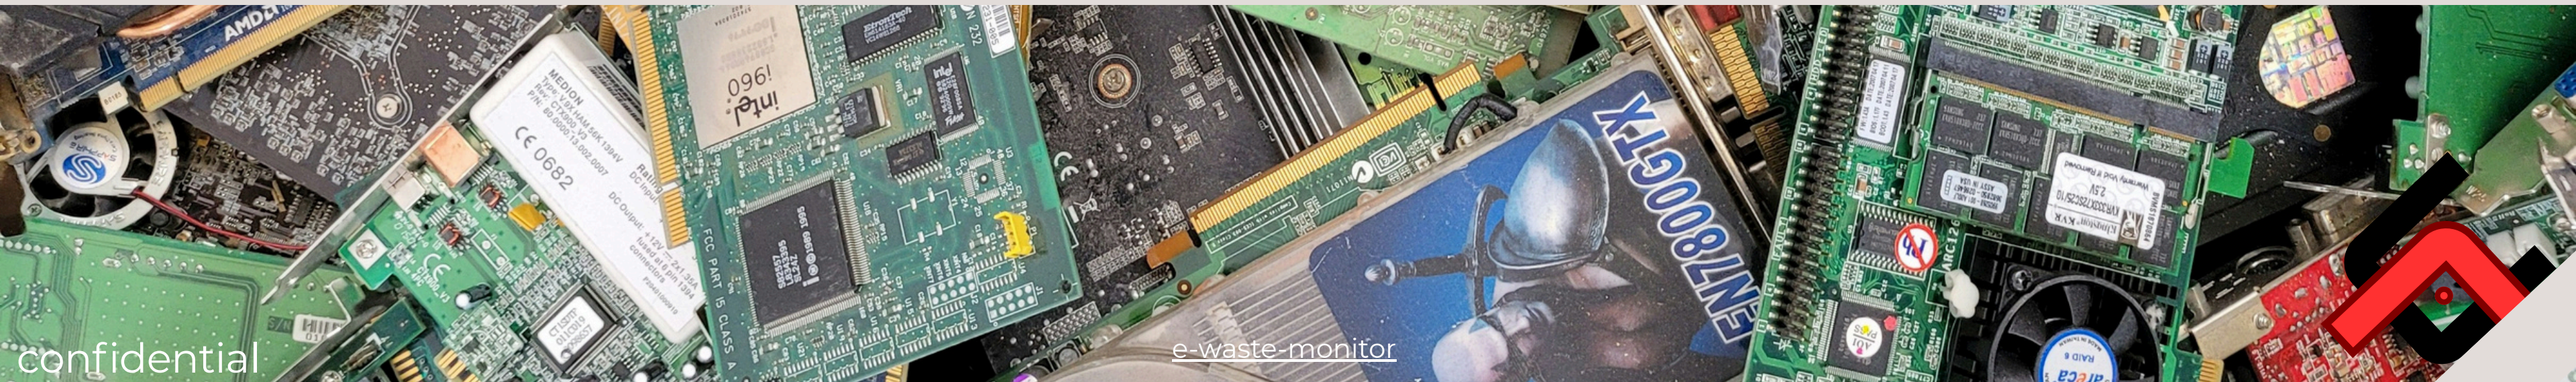
ok, so what?

confidential

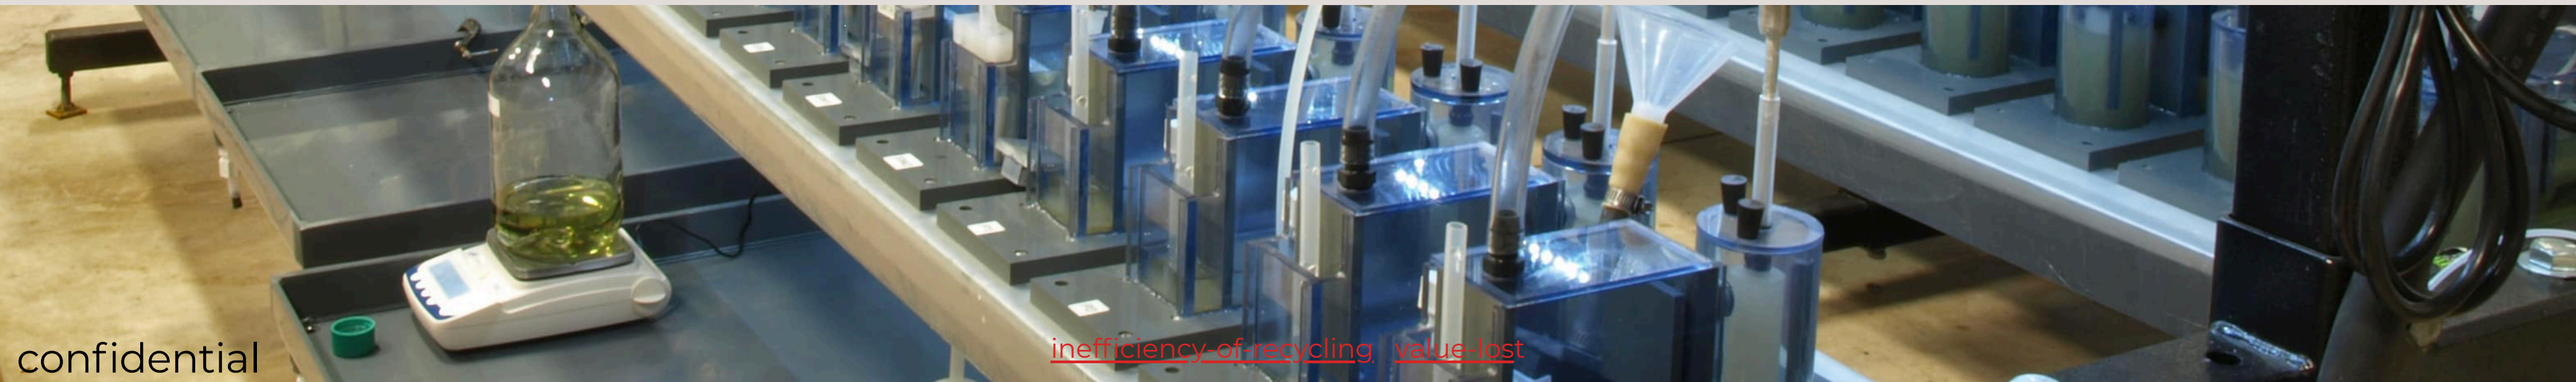
consumption has a cost.

Every year, the world produces over **62 M tonnes of electronic waste** (e-waste), of which **32 M tonnes of critical metals** contained within.



<1% of rare metals recycled.

critical raw materials are dispersed in the bulk waste, and profits do not justify the **extreme costs** and **heavy capex** for the recovery processes implementation.



e-waste is a literal gold mine.

Europe is building new plants to separate rare earths. We give that capability to those who can’t.

We offer **complementarity** to the system, **improving our client’s processes** and **cutting waste managmenet cost**, all-the-while allowing them to recover the 5% they lose.
